

E4 PROTOCOL

E4 PROTOCOL

The E4 programme consists in a combination between the production of clean renewable energy, it's storage, the transfer to the 'ICS' Intelligent Charging Station and the recharging of the battery of the Intelligent Electric Vehicle or the Intelligent Electric Fuel Cell Vehicle.

The E4 Protocol is a global agreement between the Energy Sectors (oil companies, suppliers, etc), the Transportation Sectors(automakers) and Environmental Organizations.

These three sectors can work together to change current transportation systems to clean mobility. This change will happen in a period of time adapted to everyone's needs, without harming the world's economy and at the same time by working together for a healthier environment .
